Easy with unprotected code

Then we use obfuscation

Efficient _ "Harder " to analyze #include <stdio.h> #include <stdlib.h> int main(int argc, char* argv[]) { @<89>Uù ^\+,tQ4<9a>^D<9d>¢E^Rϱ¬%Q^@^_>[^P<92>Ë^XÞ^\<9d>9N&Q<9d> int i,j, len = 16; AANAT ACO ^W<9d>L#Q^@<89>0P(^\@^X^N±Nû{<89>.P#Q^@^_>ù^L%^T<9d>^?Ê|b±T# int sum = 0; 89>0ë<^\ù.^K4 9d>d#0^@W<9 9f>e^XN(1^T<9 Obfuscation-9a> .NSt(4* e4ù^D+^\[(E^TP N81^T4(0 9a>^T.0<8 .0^D<9a>8N C Source .USO^@^ %#.ù.4 0;de}3^@^@e <89>'X= >.71N^@<89 +t) { >0N^X1(4<Q^P< lin^@W%pee 4 04^H0(<9a>^8 ATUA\+([AHEALI i++; d><9a>^IN(r 1^X4400<9a>^L MR^Waé(N^A^@O PW[^@<9a>^XN^XN Þ(ē^L4,Q, printf("Sum is: %d\n", sum); \Q^\N[0<9a>\$" ±`"Q^@^_UP4:@^ "P41(<9d> \$Q^@IE^L^DP(@<0^G<9a>\$zi^Uù(+^@N^P± <88> ^E.h"Q^@{<92>[\$NE,e d>p[™]Q^@^_U+^L^\[\$\44Q4NĚ^\>p^Lž "&\$ù(<9a>^L±p^Žl≤9b>.t[™]Q^@W<92>+^@:[^\ø?NĔ^XÑ\$T Ĵ&^\4^PQ^PÍù^L±<82>^z<92>.<84>"Q^@W^\+^@^D[0Ë^\<9a>0Ň0EP^L@^@t^@c9d>°^Os^K±<88> return 0;

Arm race

Arm race

Dynamic Symbolic Execution (DSE)

What can we do against DSE ?

- Specific operations hard to solve

 Reduces the subset of paths that can be explored

What can we do against DSE ?

What can we do against DSE ?

- DSE need to solve all constraints and store all pending states
- Realistically DSE can explore a reduced amount of paths in a limited amount of time

We need clear classification

Need clear classification and comparison

Today's contributions:

- ightarrow Classify existing protections
- → **Compare** protections using key parameters (strength, cost, stealth, implementation availability, etc.)
- \rightarrow **Point out defficiencies** in the current state-of-the-art

Hard constraints

Mixed-boolean arithmetic – ZHOU et. al. 2007

Mixed-boolean arithmetic - CHARACTERISTICS

Strength & Cost

- \rightarrow Solving constraints: NP-hard problem
- → No general results indicating that MBA are significantly harder to solve
- ightarrow Hard against simplification queries
- → No cost results for large and efficient MBA protections

- ightarrow Specific use of uncommon operators
- → Mitigation using arithmetic simplification coupled with MBA expressions equivalence Eyrolles et. al. 2016

Cryptographic hash functions — SHARIF et. al. 2008

Cryptographic hash functions- CHARACTERISTICS

Strength & Cost

- ightarrow Irreversible functions by definition
- \rightarrow Relevant part of the code encrypted
- ightarrow Encryption is not cheap

- ightarrow Cryptographic routines easy to spot
- → Limited scope (trigger-based behaviors)

Path divergence

Self-modification

call get_input() L1: call func1()

	obfuscated code						
L1: L2:	call mov call call	get_input() [L1], nop spurious_func() func1()					

Self-modification - CHARACTERISTICS

Strength & Cost

- ightarrow Theoretically not an issue for DSE
- → Current symbolic engines cannot cope with this obfuscation Moslty engineering effort
- → Full program unpacking has a high runtime cost

- → Mitigations proposed but not implemented Yadegari et. al. 2015 Brumley et. al. 2013 Bonfante et. al. 2015
- \rightarrow Self-modification easy to spot

Symbolic code — YADEGARI*et. al.* 2015

obfuscated code

call get_input() sub eax, TRIGGER // operations on eax mov [L1], eax 1: nop 2: call abort() 3: call payload()

Symbolic code — YADEGARI*et. al.* 2015

obfuscated code

call get_input() sub eax, TRIGGER // operations on eax mov [L1], eax L1: jmp L3 L2: call abort() L3: call payload()

Symbolic code- characteristics

Strength & Cost

- \rightarrow Trigger-based behavior
- → Current symbolic engines cannot cope with this protection
- ightarrow Probably no runtime cost

- → Mitigation proposed but not implemented Yadegari et. al. 2015
- ightarrow Self-modification easy to spot

Covert channel — STEPHENS et. al. 2018

original code

```
int func (int x) {
    int var = x;
    return(var);
}
```

obfuscated code

```
int func (int x) {
    int value=0;
    for( i in [0 . . . (bits in b)-1]) {
        timeT start = time();
        if (( i th bit of b)==1)
            slow_process(param);
        else
            fast_process(param);
        timeT time = time()-start;
        if (time > threshold)
            value |= 1 << i;
        }
        int var = value;
    return(var);
    }
</pre>
```

}

Covert channels - CHARACTERISTICS

Strength & Cost

- → State-of-the-art symbolic engines does not support covert channels
- → Some primitives hinder runtime performances
- \rightarrow *Probabilistically* correct

- → Sensitive to system call-based anomaly detection
- \rightarrow No mitigation proposed

Path explosion

Linear obfuscation – WANG et. al. 2011

Linear obfuscation- CHARACTERISTICS

Strength & Cost

- → Input dependant loop
- → Runtime number of loop iterations depends on input value

- ightarrow Common control flow structure
- → But unusual arithmetic operators (modulo 3 or 5)
- \rightarrow Pattern attacks

Path-oriented protections

original code

int func (int x) {
 int var = x + 10;
 return(var);
}

obfucated code - Range Divider -

int func (int x) {
 int var = 0;
 switch(x) {
 case 0:
 var = x+10;
 ...

case INT_MAX: //obfuscated version of "var=x+10"

return(var);

BANESCU et. al. 2016

obfuscated code - For -

```
int func (int x) {
    int var = 0;
    for (int i=0; i<x+10; i++) {
        var++;
    }
    return(var);
}</pre>
```

OLLIVIER et. al. 2019

Path-oriented protections - CHARACTERISTICS

Strength & Cost

- \rightarrow Input dependant loop
- \rightarrow Strength exponential to the size in bits of the input space
- ightarrow Some primitives increase the size of the code

- → Common control flow structure and no exotic operators
- \rightarrow Some primitives use large jump tables
- → Pattern attacks (need diversity)
- \rightarrow Path-merging ? Customized existing tools ?

Anti-DSE protections

Protections	Strength	Cost	Correctness	Stealth	Implementation	Mitigation					
Complex Constraints											
MBA		?	\checkmark	×	✓	√					
Crypto Hash Functions	+	?	\checkmark	×	×	×					
Path Divergence											
Self-modification			\checkmark	×	✓	✓					
Symbolic Code			\checkmark		×	\checkmark					
Covert Channel	+		×		✓	×					
Path Explosion											
Linear Obfuscation		+	\checkmark		×	×					
Path-oriented	++	++	\checkmark		×	×					
		Bad/NoMedium	? Unknown† Some expension	rimental evaluation							
		Good	++ Large experimental evaluation								

Conclusion

State-of-the-art in anti-DSE protections unclear

 \rightarrow We propose a classification and comparison of existing work

State-of-the-art insufficiency and call for action:

- \rightarrow Many implementations not available
- ightarrow Many studies lack strong enough experimental evaluation
- ightarrow Cost and stealth are often overlooked
